PROFESSIONAL SUMMARY

Software Development Engineer with 4+ years architecting transaction-critical microservices for a Fortune 50 US bank, currently processing 4,500+ transactions/hour at 99.9% reliability on Kubernetes. Specializes in Java 17, Spring Boot, and event-driven systems (Kafka, IBM MQ); cut deployment time 70% through CI/CD automation on Red Hat OpenShift. Building full-stack and cloud-native depth (React, TypeScript, Azure) to bridge backend reliability with modern product delivery.

TECHNICAL SKILLS

Languages: Java 17 / 11 / 8, SQL, Bash, TypeScript

Frameworks: Spring Boot, Spring Data JPA, Spring Security (OAuth 2.0 / JWT), JUnit, Mockito, React, Angular

Architecture: Microservices, REST APIs, Event-Driven Design, Batch Processing, API Gateway Patterns, System Design

Messaging: Apache Kafka, IBM MQ, JMS

Platform: Kubernetes (Red Hat OpenShift), Docker, Tekton, Harness, GitHub Actions

Databases: MS SQL Server, Oracle SQL, DB2, Redis

Tools: Git, Postman, IntelliJ IDEA, VS Code

Certifications: Oracle Certified Java SE 8 Programmer (96%)

EXPERIENCE

Software Development Engineer | Tata Consultancy Services | Chennai, IN

May 2022 – Present

Client: Top-5 US Bank (Fortune 50)

- Re-architected a legacy banking system into Spring Boot microservices, consolidating 40+ stored procedures into 12 REST endpoints and reducing production incident volume ~30% through cleaner service boundaries and centralized error handling..
- Achieved 99.9% message reliability across 4,500+ transactions per hour by building an event-driven batch platform with Spring Boot, Spring Data JPA, and IBM MQ.
- Eliminated unauthorized external vendor access by designing a JWT/OAuth 2.0 API gateway in Java 17, now the single entry point for 100% of vendor traffic to internal banking services.
- Cut deployment time by 70% (hours to minutes) by rebuilding CI/CD pipelines using Tekton and Harness targeting Kubernetes on Red Hat OpenShift.
- Established Git branching conventions and code-review standards for a 5-engineer team, cutting PR turnaround from days to same-day and eliminating recurring merge-conflict rework..
- Eliminated recurring transient-failure incidents by adding retry logic and automated alerting to Autosys batch workflows.

KEY PROJECTS

Balance Control Application — Spring Boot, IBM MQ, Kubernetes (OpenShift)

- Delivered 24x7 uptime through traffic spikes by deploying a real-time transaction earmarking service on OpenShift with tuned pod autoscaling; processes 100% of requests with zero manual intervention via asynchronous JMS consumption.
- Contributed to integration architecture decisions as a design collaborator, not solely an implementer.

Vendor API Gateway — Java 17, Spring Boot, JDBC

- Secured 100% of external vendor traffic by launching a gateway enforcing JWT bearer-token authentication; reduced data-layer boilerplate using Java 17 Records with JDBC.

Transaction Management Batch System — Java, Spring Boot, JAXB

- Designed a JDBC-backed batch system processing end-to-end banking transaction lifecycles (create / update / status); resolved undocumented XML edge cases from an upstream system with zero post-launch parsing defects.

EDUCATION

B.Tech, Biotechnology | Anna University, Chennai

2021
